MEDIALIALIUN C. LILGUAGE C. MILEGIAGIS E., Henrique D., Carcangiu M.-L., A Banks A., Leiman J., Ward D., Ish-Horowitz D., Artavanis-Tsakonas S.; Thuman ligands of the Norch receptor.";

Am. J. Pathol. 154:785-794(1999).

- I- FUNCTION: Functions as a receptor for membrane-bound ligands of the Norch receptor.";

- I- FUNCTION: Functions as a receptor for membrane-bound ligands of the Jagged1, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released norch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and appototic programs. May regulate branching morphogenesis in the developing vascular system (By similarity).

- SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isoid=099466-3; Sequence-VSP 001407; Isoid=099466-3; Sequence-VSP 001407; ItSSUE SPECIFICITY: Highly expressed in the heart, moderately in the lung and placenta and at low levels in the liver, skeletal muscle, kidney, pancreas, spleen, lymph node, thymus, bone marrow and fetal liver. No expression was seen in adult brain or peripheral blood leukocytes.

J. Mol. Bvol. 36:255-262(1993).

-!- FUNCTION: Metallothioneins have a high content of cysteine
residues that bind various heavy metals.
-!- DOWAIN: Class I metallothioneins contain 2 metal-binding domains:
four divalent ions are chelated within cluster A of the alpha
domain and are coordinated via cystein/I thiolate bridges to 11
cysteine ligands. Cluster B, the corresponding region within the
beta domain, can ligate three divalent ions to 9 cysteines.
-!- SIMILARITY: Belongs to the metallothionein superfamily. Family 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                   through subsequent stages.

MISCELLANEOUS: Expressed both maternally and zygotically.
SIMILANTY: Contains 1 avidin domain.
SIMILANITY: Contains 1 CUB domain.
SIMILANITY: Contains 8 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           calcium-binding (

"Jagged2: a serrate-like gene expressed during rat embryogenesis.";
L. bev. Baol. 180:370-376[1966].

-! FUNCTION: Putative Notch ligand involved in the mediation of Notch signaling. May have a role in neurogenesis in the peripheral nervous system, limb development and in the adult brain.

-! SUBCLIDIAR LOCATION: Type I membrane protein.

-! Buyle And Stage Ell.5 is it is detected in dorsal root ganglia, AER, and surface ectcoderm. At El4.5, found as well in salivary gland, tooth buds and hair follicles.

-! SIMILARITY: Contains 16 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. Le FUNCTION: Putative Norch ligand involved in the mediation of Norch signaling. Plays an essential role during limb, craniofacial and chymology plays an essential role during limb, craniofacial and cevelopment of peripheral and central nervous systems.

Lipsub SPECLIFICITY: Found to be highest in fetal thymus, epidermis, foregut dorsal root ganglia and inner ear. In 2-week.

Clamice, abundant in heart, lung, thymus, skeletal muscle, brain and teetis. Expression overlaps partially with Notchl expression.

Cloral root ganglia. At 13 dpc, found in paravertebral vessels and developing thymus and in the muscles of the tongue. By 15 dpc, in many risans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. Amidation; Calcium channel inhibitor; Direct protein sequencing; Ionic channel inhibitor; Neurotoxin; Presynaptic neurotoxin; Signal;
similarity). This toxin blocks N-type calcium channels.
-!- SUBCELULAR LOCATION: Secreted.
-!- TISSUE SPECIFULTY: Expressed by the venom duct.
-!- SIMILARITY: Belongs to the conotoxin O-superfamily. Omega-type

Biochemistry 35.2836-2844sersible paralysis in lepidopterous insects
-!-PUNCTION: Causes irreversible paralysis in lepidopterous insects
by massive transmitter release (which is mediated by glutamate
receptors) from presynaptic stores at neuromuscular junctions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                  "Solution structure determination by two-dimensional 1H NMR of omega-
conotoxin MVIID, a calcium channel blocker peptide.";
Biochem. Biophys. Res. Commun. 254:32-35(1999).
--- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bin
and block voltage-sensitive calcium channels (VSCC). This toxin
blocks channels of the N-type as well as other types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This peptide inmobilize fish which are injected with the two peptides. Injection of kappa-conotoxin PVIIA and synergistically to rapidly kappa-conotoxin PVIIA alone results in different symptoms with an injected fish becoming hyperactive and then contracting and suddenly extending all major fins. This "fin-popping" occurs repeatedly resulting in a series of jerky movements, but injection of only kappa-conotoxin PVIIA does not immobilize or kill the fish

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                  /note= "The C-terminus is either a carboxyl group or amide group"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, neuropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral exerappanting subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (GASG) surgery, ischaemic heart disease, asthma, and congestive heart failure. The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with channel, especially cardiac ischaeme by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; F9Y.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprisaing administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-
                                                                                                                                                                          /note= "The C-terminus is either a carboxyl group or an amide group"

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprishing administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.

                                                                                                                                                                                                                                                         The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arthythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                             Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia, anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.

Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                      The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arthythmia, utinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conctoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conctoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, errebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conctoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; V27A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     note= "The C-terminus is either a carboxyl group or an
activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                      present
Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                     The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, treatment of arrivhthmia, urinary incontinence, reperfusion injury, treatment of arrivhthmia, urinary incontinence, reperfusion injury, peripheral circulation disturbances, hypertension, angina, cerebral escribaral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemia, coronary artery bypass graft (CABG) surgery, sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory;

ö
The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-concorxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conctoxins are used for treating disorders associated with channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conctoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a mammal comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasa accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
cerebral ischaemia, coronary artery bypass graft (CABG) surgery,
ischaemic heart disease, asthma and congestive heart failure. The preser
sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular analogue of the invention

The invention relates to treating disorders associated with radical comprisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-contoxin PVIIA (Kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                                                       Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory;
cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia;
cerebral ischaemia; ocular ischaemia; asthma; I3A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to kappa-PVIIA-related conotoxins and their use as organ of a mammal using kappa-PVIIA-protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, neptropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ecerbral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemia, coronary artery bypass graft (CABG) surgery, stokaemic heart disease, asthma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to kappa-PVIIA-related conotoxins and their use as protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, utinary incontinence, respectuals in injury, diabetes, retinopathy, neuropathy, apphropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral usosopasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (GABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active radical depolarisation of excitable membrane by activatival depolarisation of excitable membrane by activating a specially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia, and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                         Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; R18A.

                                                                                                                                                                                                   The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conctoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active radical depolarisation of excitable membrane by activating a depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conctoxin PVIIA analogue of the invention
